There has been considerable discussion concerning the number of applications of interim paint needed for a project. It has been determined that the pavement marking quantities for interim paint will consist of two applications (double the quantity) on all projects. The only exception to this will be on chip seal only projects. Epoxy pavement markings will remain the same (single application).

Road Design will need to place a note below the Pavement Marking Frame in the Road Design plans stating that the quantities shown for interim paint is for two applications.

This change takes effect with the September 2006 letting.
